- Tagging is a simple way to attach a classification to an event or an attribute.
- In the early version of MISP, tagging was local to an instance.
- **Classification must be globally used to be efficient**.
- After evaluating different solutions of classification, we built a new scheme using the concept of machine tags.

1

- Triple tag, or machine tag, format was introduced in 2004 to extend geotagging on images.

admiralty-scale:source-reliability="c"
namespace   predicate   value

- A machine tag is just a tag expressed in way that allows systems to parse and interpret it.
- Still have a human-readable version:
  ▶ admiralty-scale:source-reliability="Fairly reliable"

MISP TAXONOMIES

- Taxonomies are implemented in a simple JSON format.
- Anyone can create their own taxonomy or reuse an existing one.
- The taxonomies are in an independent git repository[1].
- These can be freely reused and integrated into other threat intel tools.
- Taxonomies are licensed under Creative Commons (public domain) except if the taxonomy author decided to use another license.

16

EXISTING TAXONOMIES

■ NATO - **Admiralty Scale**

■ CIRCL Taxonomy - **Schemes of Classification in Incident Response and Detection**

■ eCSIRT and IntelMQ incident classification

■ EUCI **EU classified information marking**

■ Information Security Marking Metadata from DNI (Director of National Intelligence - US)

■ NATO Classification Marking

■ OSINT **Open Source Intelligence - Classification**

■ TLP - **Traffic Light Protocol**

■ Vocabulary for Event Recording and Incident Sharing - **VERIS**

■ And many more like ENISA, Europol, or the draft FIRST SIG Information Exchange Policy.

```
1  {
2    "namespace": "admiralty-scale",
3    "description": "The Admiralty Scale (also called the NATO System
         ) is used to rank the reliability of a source and the
         credibility of an information.",
4    "version": 1,
5    "predicates": [
6      {
7        "value": "source-reliability",
8        "expanded": "Source Reliability"
9      },
10     {
11       "value": "information-credibility",
12       "expanded": "Information Credibility"
13     }
14   ],
15  ....
```

```
 1  {
 2     "values": [
 3        {
 4          "predicate": "source-reliability",
 5          "entry": [
 6             {
 7               "value": "a",
 8               "expanded": "Completely reliable"
 9             },
10  ....
```

- Publishing your taxonomy is as easy as a simple git pull request on misp-taxonomies[2].

---

[2]https://github.com/MISP/misp-taxonomies

- MISP administrator can just import (or even cherry pick) the namespace or predicates they want to use as tags.
- Tags can be exported to other instances.
- Tags are also accessible via the MISP REST API.

Information Sharing and Taxonomies

2024-04-15

└─Filtering the distribution of events among MISP instances

■ Applying rules for distribution based on tags:

- Tags can be used to set events or attributes for **further processing by external tools** (e.g. VirusTotal auto-expansion using Viper).
- Ensuring a classification manager **classifies the events before release** (e.g. release of information from air-gapped/classified networks).
- **Enriching IDS export** with tags to fit your NIDS deployment.
- Using **IntelMQ** and MISP together to process events (tags limited per organization introduced in MISP 2.4.49).

- **Sighting** support (thanks to NCSC-NL) is integrated in MISP allowing to auto expire IOC based on user detection.
- Adjusting taxonomies (adding/removing tags) based on their score or visibility via sighting.
- Simple taxonomy editors to **help non-technical users** to create their taxonomies.
- **Filtering mechanisms** in MISP to rename or replace taxonomies/tags at pull and push synchronisation.
- More public taxonomies to be included.

- **Python module** to handle the taxonomies
- **Offline** and online mode (fetch the newest taxonomies from GitHub)
- Simple **search** to make tagging easy
- Totally independent from MISP
- **No external dependencies** in offline mode
- Python3 only
- Can be used to create & **dump a new taxonomy**

PyTaxonomies

```python
from pytaxonomies import Taxonomies
taxonomies = Taxonomies()
taxonomies.version
# => '20160725'
taxonomies.description
# => 'Manifest file of MISP taxonomies available.'
list(taxonomies.keys())
# => ['tlp', 'eu-critical-sectors', 'de-vs', 'osint', 'circl', 'veris',
#         'ecsirt', 'dhs-ciip-sectors', 'fr-classif', 'misp', 'admiralty-scale', ...]
taxonomies.get('enisa').description
# 'The present threat taxonomy is an initial version that has been developed on
# the basis of available ENISA material. This material has been used as an ENISA-internal
# structuring aid for information collection and threat  consolidation purposes.
# It emerged in the time period 2012-2015.'
print(taxonomies.get('circl'))
# circl:incident-classification="vulnerability"
# circl:incident-classification="malware"
# circl:incident-classification="fastflux"
# circl:incident-classification="system-compromise"
# circl:incident-classification="sql-injection"
# ....
print(taxonomies.get('circl').machinetags_expanded())
# circl:incident-classification="Phishing"
# circl:incident-classification="Malware"
# circl:incident-classification="XSS"
# circl:incident-classification="Copyright issue"
# circl:incident-classification="Spam"
# circl:incident-classification="SQL Injection"
```

- False-positives are a **common issue** in threat intelligence sharing.
- It's often a contextual issue:
  - ▶ False-positives might be different per community of users sharing information.
  - ▶ Organizations might have their **own view** on false-positives.
- Based on the success of the MISP taxonomy model, we built misp-warninglists.

MISP WARNING LISTS

- misp-warninglists are lists of well-known indicators that can be associated to potential false positives, errors, or mistakes.
- Simple JSON files

```
1  {
2    "name": "List of known public DNS resolvers",
3    "version": 2,
4    "description": "Event contains one or more public DNS resolvers
          as attribute with an IDS flag set",
5    "matching_attributes": [
6      "ip-src",
7      "ip-dst"
8    ],
9    "list": [
10     "8.8.8.8",
11     "8.8.4.4", ...]
12 }
```

14   16

MISP WARNING LISTS

- The warning lists are integrated in MISP to display an info/warning box at the event and attribute level.

- Enforceable via the API where all attributes that have a hit on a warninglist will be excluded.

- This can be enabled at MISP instance level.

- Default warning lists can be enabled or disabled like **known public resolver, multicast IP addresses, hashes for empty values, rfc1918, TLDs** or **known Google domains**.

- The warning lists can be expanded or added in JSON locally or via pull requests.

- Warning lists can be also used for **critical or core infrastructure warning, personally identifiable information**...
